In classical field theories, the Lagrangian specification of the flow field is a way of looking at fluid motion where the observer follows an individual fluid parcel as it moves through space and time. Plotting the position of an individual parcel through time gives the pathline of the parcel. This can be visualized as sitting in a boat and drifting down a river.

When allowing the grid to move as in the vertical Lagrangian-remap method, motion of fluid elements and thus the transport of fluid properties are measured relative to the moving grid. This transport is the dia-surface transport detailed mathematically in section D0.4. If the grid lines are fixed, as in an Eulerian method, then advective ...

We would like to note that in a Lagrangian scheme the velocity at each side of x_i used here should be the relative fluid velocity, that is, $u_i - x_i'$ and $u_i + x_i'$, where $u_i = M_i / \rho_i$, $u_i + = M_i + / \rho_i +$ and x_i' is the cell boundary's reference moving velocity which can be numerically determined as the Roe average $\rho_i u_i - + \rho_i + u_i + \rho_i - + \rho_i +$.

The Semi-Lagrangian scheme is a numerical method that is widely used in numerical weather prediction models for the integration of the equations governing atmospheric motion. A Lagrangian description of a system focuses on following individual air parcels along their trajectories as opposed to the Eulerian description, which considers the rate of change of system variables fixed at a particular point in space.
