Actually, there are two kinds of matrices, viz. a refraction matrix describing the refraction at a lens surface, and a translation matrix, describing the translation of the plane of reference to the next refracting surface, where another refraction matrix applies. The optical system, consisting of a combination of lenses and/or reflective elements, is simply described by the matrix resulting from the product of the components' matrices.

Matrices: Theory and Applications

Cayley quickly saw the significance of the matrix concept and by 1853 Cayley had published a note giving, for the first time, the inverse of a matrix. Cayley in 1858 published Memoir on the theory of matrices which is remarkable for containing the first abstract definition of a matrix. He shows that the coefficient arrays studied earlier for quadratic forms and for linear transformations are special cases of his general concept.

An adjacency matrix therefore describes whether two vertices are adjacent (1) or not (0). Every item in an adjacency matrix is simply a Boolean that describes connectivity. In an adjacency matrix, the graph G with the set of vertices V & the set of edges E translates to a matrix of size V^2 . Rows & columns are both labeled after the same the single set of vertices for any graph G .
