Resolution Enhancement Techniques In Optical

Resolution enhancement technologies are methods used to

modify the photomasks in the lithographic processes used to make integrated circuits to compensate for limitations in the optical resolution of the projection systems. These processes allow the creation of features well beyond the limit that would normally apply due to the Rayleigh criterion. Modern technologies allow the creation of features on the order of 5 nanometers, far below the normal resolution possible using deep ultraviolet light

Resolution enhancement technologies - Wikipedia

Abstract. Over the past decade, optical lithography's k_1 factor has been continuously eroding despite aggressive improvements in exposure wavelength and numerical aperture. To compensate for the increased difficulty in maintaining adequate process windows at smaller k_1 's, lithographers have gradually introduced mild resolution enhancement techniques (RETs) such as the use of optical proximity correction (OPC) and attenuated phase shifted mask enhanced lithography (attPSM).

Super-resolution imaging is a class of techniques that enhance the resolution of an imaging system. In optical SR the diffraction limit of systems is transcended, while in geometrical SR the resolution of digital imaging sensors is enhanced. In some radar and sonar imaging applications, subspace decomposition-based methods and compressed sensing-based algorithms are employed to achieve SR over standard periodogram algorithm. Super-resolution imaging techniques are used in general image processing

Super-resolution imaging - Wikipedia

Optical lithography research has developed several resolution enhancement techniques, including optical proximity correction, off-axis illumination, and phase-shift photomasks [8]. The aim is to maintain high pattern fidelity at maximum resolution. Phase-shifting photomasks offer the best resolution enhancement potential for sub-wavelength patterning in projection lithography [9,10].
