The procedure has shown that the point at which 50% of the disks are floating (the median or ET 50) is a reliable and repeatable point of reference. In this case, the disks floating are counted at the end of each time interval. The median is chosen over the mean as the summary statistic. The median will generally provide a better estimate of

The Floating Leaf Disk Assay for Investigating Photosynthesis

Normally, disks punched out of leaves (with a hole punch) would float. When the air spaces are infiltrated with a sodium bicarbonate solution, the overall density of the leaf disks increase and they sink. Bicarbonate ion serves as the carbon source for photosynthesis. As photosynthesis proceeds, oxygen is released into the interior of the leaf, which changes the buoyancy- causing the disks to rise.
