Particles intermediate in size between those found in solutions and suspensions can be mixed in such a way that they remain evenly distributed

without settling out. These particles range in size from 10^{-8} to 10^{-6} m in size and are termed colloidal particles or colloids. The mixture they form is called a colloidal dispersion.

A colloid is intermediate between a solution and a suspension. While a suspension will separate out a colloid will not. Colloids can be distinguished from solutions using the Tyndall effect. Light passing through a colloidal dispersion, such as smoky or foggy air, will be reflected by the larger particles and the light beam will be visible.

Classifying Mixtures

make a solution. colloid: a mixture containing particles larger than the solute but small enough to remain suspended in the continuous phase of another component. This is also called a colloidal dispersion. Tyndall Effect: the scattering of a light beam as it passes through a colloid. suspension: heterogeneous mixture that contains fine solid

Activity 3 Solutions, Suspensions, and Colloids

The particles in a solution affect the colligative properties of the solution, while the particles in a colloid or suspension have no effect on colligative properties. Solutions do not exhibit the Tyndall Effect, while colloids and suspensions do. The Tyndall Effect describes the scattering effect of dispersed particles on a beam of light. Particles in solution are too small relative to the wavelength of the light to cause scattering, but the particles in colloids and suspensions are large ...

Difference Between Suspension and Colloid. Let's explore some of the primary differences between colloids and suspensions. Particle Size: The very first difference between the two is the size of the particles found in them. Where colloids have particles sizing in the range of 1 to 1000 nm, suspensions consist of particles above 1000 nm size.
