Pseudomonas Aeruginosa Isolated From The

Pseudomonas aeruginosa is a common encapsulated, Gram-negative, rod-shaped bacterium that can cause disease in plants and animals, including humans. A species of considerable medical importance, P. aeruginosa is a multidrug resistant pathogen recognized for its ubiquity, its intrinsically advanced antibiotic resistance mechanisms, and its association with serious illnesses – hospital ...

Pseudomonas aeruginosa - Wikipedia

Abstract. In order to improve our understanding of the colonization of the pulmonary tract of cystic fibrosis (CF) patients by Pseudomonas aeruginosa, 162 isolates from five different ecological origins were studied. The genetic features of each isolate were determined by random amplification of polymorphic DNA (RAPD) and by

searching for eight virulence genes (six known virulence genes, *algD*, *lasB*, *toxA*, *plcH*, *plcN* and *exoS*, and two genes encoding putative neuraminidases, *nan1* and *nan2*).

Pseudomonas is a type of bacteria (germ) that is found commonly in the environment, like in soil and in water. Of the many different types of *Pseudomonas*, the one that most often causes infections in humans is called *Pseudomonas aeruginosa*, which can cause infections in the blood, lungs (pneumonia), or other parts of the body after surgery. See CDC's report.

Pseudomonas aeruginosa: Isolation and identification. *Pseudomonas aeruginosa* is a gram-negative, motile rod belonging to the family *Pseudomonadaceae*. These bacteria are commonly found in soil and water. *Pseudomonas aeruginosa* can resist variety of physical conditions such as dyes, weak antiseptics, commonly used antibiotics and tolerate high salt concentration.

Pseudomonas aeruginosa and *Candida albicans* are two opportunistic pathogens often co-isolated from infections, mainly from mucosal tissues like the lung. Despite the billions of years of co-existence, this pair of microorganisms is a great example on how little is known about cross-kingdom interactions, particularly within the context of coinfections.

The major pathogen from the group of non-fermenting gram-negative bacteria is *Pseudomonas aeruginosa*. Small gram negative rods measuring around 2 μm are pseudomonads. They are single motile bacteria with one polar flagellum, non-spore forming. Multiple fimbriae and pili promote epithelial cell microbial attachment. Typically isolated from cystic fibrosis patients, multiple mucoid strains ...

Pseudomonas aeruginosa, one of the most common bacteria isolated from chronic wounds, is an opportunistic pathogen with innate resistance to many antibiotic classes, including antipseudomonal penicillins, carbapenems, aminoglycosides and ciprofloxacin [2, 3].

Pseudomonas aeruginosa is an opportunistic pathogen involved in many infections. Carbapenem-resistant *P. aeruginosa* has emerged as an important cause of infection in different hospitals worldwide. We aimed to determine frequencies of the four main resistance mechanisms [metallo-beta lactamase (MBL) production (blaIMP, blaVIM, blaSPM and blaNDM), overproduction of the MexAB-OprM and MexXY efflux pumps, overproduction of chromosome-encoded AmpC β -lactamase, and reduced OprD expression ...

Pseudomonas aeruginosa is a Gram-negative nosocomial pathogen that is a leading cause of morbidity and mortality in cystic fibrosis patients and immunocompromised individuals worldwide. The isolate examined in this study, PA14-UM, is a well-characterized isolate utilized in studies from the University of Maryland.

Pseudomonas aeruginosa is an environmentally ubiquitous opportunistic

pathogen. Epidermal infections often result from *P. aeruginosa* infiltrating through a human host's first line of defenses, entering the body through the skin at the site of an open wound.
