Introduction To Generalized Linear Models

The term generalized linear model (GLM or GLM) refers to a larger class of models popularized by McCullagh and Nelder (1982, 2nd edition 1989). In these models, the response variable is assumed to follow an exponential family distribution with mean μ , which is assumed to be some (often nonlinear) function of η .

Introduction Generalized Linear Models Structure. For example, a common remedy for the variance increasing with the mean is to apply the log transform, e.g. $\log(y_i) = 0 + 1x_i + \epsilon_i$. $E(\log Y_i) = 0 + 1x_i$. This is a linear model for the mean of $\log Y$ which may not always be appropriate.

Generalized linear mixed models (or GLMMs) are an extension of linear mixed models to allow response variables from different distributions, such as binary responses. Alternatively, you could think of GLMMs as an extension of generalized linear models (e.g., logistic regression) to include both fixed and random effects (hence mixed models).

The generalized linear model, it's important to recognize, can only handle between-subjects factors. So we'll be looking at just between-subjects situations for the generalized linear model. And later in the course, we'll consider the generalized linear mixed model and the linear mixed model, which add the opportunity to do within-subjects analyses of experiments.
