To use this with stoichiometry you need to combine it with one last law, which is Avogadro's law. It states that at constant temperature and pressure equal volumes of gas contain the same number of moles. The equation is $V/n=k$ V- volume n- moles k- constant When all four of these laws are combined together they make the ideal gas law. The equation for that (this is the important part since we will be using it for stoichiometry) is $PV=nRT$.

To get four hydrogen atoms on the right, add a coefficient of 2 for the hydrogen gas. The coefficient is a number that goes in front of a chemical formula. Remember, coefficients are multipliers, so if we write $2\text{H}_2\text{O}$ it denotes $2 \times 2 = 4$ hydrogen atoms and $2 \times 1 = 2$ oxygen atoms. The equation is now balanced.
