Bacteria and viruses are both microscopic organisms that can cause disease in humans. While these microbes may have some characteristics in common, they are also very different. Bacteria are typically much larger than viruses and can be viewed under a light microscope.

## **Differences Between Bacteria and Viruses**

Viruses are the smallest and simplest life form known. They are 10 to 100 times smaller than bacteria. The biggest difference between viruses and bacteria is that viruses must have a living host - like a plant or animal - to multiply, while most bacteria can grow on non-living surfaces.

## **Bacteria vs Virus - Difference and Comparison | Diffen**

8 Introduction to Viruses Viruses are typically described as obligate intracellular parasites , acellular infectious agents that require the presence of a host cell in order to multiply. Viruses that have been found to infect all types of cells - humans, animals, plants, bacteria, yeast, archaea, protozoa...some

scientists even claim they have found a virus that infects other viruses!

### **Introduction to Viruses - General Microbiology**

Infection, often the first step, occurs when bacteria, viruses or other microbes that cause disease enter your body and begin to multiply. Disease occurs when the cells in your body are damaged — as a result of the infection — and signs and symptoms of an illness appear. In response to infection, your immune system springs into action.

### **Germes: Understand and protect against bacteria, viruses ...**

A virus can be simply defined as an obligate intracellular parasite. Each viral

particle, or virion, consists of a single nucleic acid, RNA or DNA, encoding the viral genome surrounded by a protein coat, and is capable of replication only within the living cells of bacteria, animals or plants. Viruses are classified into different orders and families by consideration of the type of nucleic acid ...
