Block diagram reduction Techniques - Transfer Function

Block Diagram Reduction Subsystems are represented in block diagrams as blocks, each representing a transfer function. In this unit we will consider how to combine the blocks corresponding to individual subsystems so that we can represent a whole system as a single block, and therefore a single transfer function.

Let us discuss these rules, one by one for reduction of control system block diagram. If you're looking to do some control systems study, check out our control systems MCQs . If the transfer function of input of control system is R(s) and the corresponding output is C(s), and the overall transfer function of the control system is G(s), then the control system can be represented as:

Basic Elements of Block Diagram. The basic elements of a block diagram are a block, the summing point and the take-off point. Let us consider the block diagram of a closed loop control system as shown in the following figure to identify these elements. The above block diagram consists of two blocks having transfer functions G(s) and H(s).

Simplify the block diagram shown in Figure 3-42. Solution. First, move the branch point of the path involving HI outside the loop involving H₁, as shown in Figure 3-43(a). Then eliminating two loops results in Figure 3-43(b). Combining two blocks into one gives Figure 3-33(c). A-3-2. Simplify the block diagram shown in Figure 3-13.

EXAMPLE PROBLEMS AND SOLUTIONS

Block diagram reduction is mostly a (control or signals and systems) textbook exercise, if one thinks about LTI (linear time-invariant) systems. If you want to extract the transfer function from a LTI system block description, use Mason's rule (Mason's gain formula - Wikipedia) because it is faster and simpler.
