The Charpy impact specimens are produced as a bar containing a notch. The swinging arm of the impact tester provides the impact. The sample will fracture along the plane indicated by the red line below. The arm continues through after impacting and the height it swings to is a direct indication of the amount of energy absorbed during fracture.

The Charpy impact test, also known as the Charpy V-notch test, is a standardized high strain-rate test which determines the amount of energy absorbed by a material during fracture. Absorbed energy is a measure of the material's notch toughness. It is widely used in industry, since it is easy to prepare and conduct and results can be obtained quickly and cheaply.

Standard Charpy V-Notched Test specimens Impact tester Furnace Introduction Notched-bar impact test of metals provides information on failure mode under high velocity loading conditions leading sudden fracture where a sharp stress raiser (notch) is present.

The Charpy test measures the energy absorbed by a standard notched specimen while breaking under a three-point bending impact load. The most common method of measuring impact energy in steels today is the Charpy V-notch test (Fig. 2a). Other notch configurations (U-notch, keyhole, etc.) can be used.
