We estimate the sparse covariance using the adaptive thresholding technique as in Cai and Liu (2011), taking into account the fact that direct observations of the idiosyncratic components are unavailable. The impact of high dimensionality on the covariance matrix estimation based on the factor structure is then studied. PMID: PMC3363011 PMID:

In this paper, we study the problem of high-dimensional covariance matrix estimation with missing observations. We propose a simple procedure computationally tractable in high-dimension and that does not require imputation of the missing data. We establish non-asymptotic sparsity oracle inequalities for the estimation of the covariance matrix involving the Frobenius and the spectral norms which are valid for any setting of the sample size, probability of a missing observation and the ...

To achieve reliable estimation in the high-dimensional setting, an effective technique is to exploit the intrinsic structure of the covariance matrix, e.g., by sparsity regularization. For sparsity regularization, the lasso penalty is popular and convenient due to its convexity but has a bias problem. A nonconvex penalty can alleviate the bias problem, but the involved nonconvex problem under positive-definiteness constraint is generally difficult to solve.

The following proposition lays the foundations for the analysis of high-dimensional covariance or precision matrix estimation with infinite kurtosis. It extends Theorem 5 in Fan et al. It is well-known that the sample covariance matrix performs poorly in high dimensions. In the last decades, a fast growing literature on estimation of high-dimensional covariance matrix arises under structural assumptions or equivalent sparsity. In this paper, we give a selective review of covariance and precision matrix estimation when the matrix dimension can be diverging with, or even larger than the sample size. Two broad categories of regularization methods are presented. The first category exploits an assumed structure of the covariance or precision matrix for consistent estimation.

High-dimensional covariance matrix estimation - Lam - 2020 ...

Using a matrix regression model as in Bigot et al. (2010), we propose a new methodology for high-

dimensional covariance matrix estimation based on empirical contrast regularization by a group Lasso penalty. Using such a penalty, the method selects a sparse set of basis functions in the dictionary used to approximate the process X .

Group Lasso Estimation of High-dimensional Covariance Matrices

If $n > p$, the log-likelihood achieves its maximum for $\hat{\Omega}^{ML} = S^{-1}$. In the high-dimensional setting where $p > n$, the sample covariance matrix is singular and its inverse is undefined. Consequently, so

is $\hat{\Omega}^{ML}$. A common workaround is the addition of a penalty to the log-likelihood (1).

Estimation of large covariance matrices, particularly in situations where the data dimension p is comparable to or larger than the sample size n , has attracted a lot of attention recently. The abundance of high-dimensional data is one reason for the interest in the problem: gene arrays, fMRI, various kinds of spectroscopy, climate
