Conductive anodic filament (CAF) formation was first reported in 1976. This electrochemical failure mode of electronic substrates involves the growth of a coppercontaining filament subsurface

along the epoxy-glass interface, from anode to cathode. Despite the projected lifetime reduction due to CAF, field failures were not identified in the 1980s. Recently, however, field failures of critical equipment have been reported.

Conductive anodic filament - Wikipedia

Conductive Anodic Filament (CAF) failure is a common and growing concern in the electronics industry. It has the potential to be a catastrophic failure mode, where a conductive salt containing copper can form within printed circuit boards (PCBs).

Guide to PCB CAF Issues | Conductive Anodic Filament

03 Apr 2018. Author: Keith Armstrong. CAF is metal filaments that can grow from copper via-hole plating along the glass fibres embedded in PCB materials such as FR4.

PCB reliability problems due to the growth of CAF ...

Catastrophic electrical failure only occurs when the filament of copper salts bridge the anode and cathode in question. Under humid conditions the salts are conductive and will allow a massive increase in current flow between the previously well-isolated copper areas and consequently circuit failure occurs.

The CAF Mechanism

One failure mechanism of particular concern is conductive anodic filament formation, which typically occurs in two steps: degradation of the resin/glass fiber bond followed by an electrochemical reaction. The glass-resin bond degradation provides a path along which electrodeposition occurs due to electrochemical reactions.
