A positive edge detector will send out a pulse whenever the signal it is

monitoring changes from 0 to 1 (positive edge). Design The idea behind a positive edge detector is to delay the original signal by one clock cycle, take its inverse and perform a logical AND with the original signal.

Verilog Positive Edge Detector - ChipVerify

Since the sobel-edge detection unit receives only a single 8-bit pixel when the i_valid signal is high, the unit must be able to store the first eight 8-bit pixels until the 9th pixel is received. The key idea of the memory module is the program counter, PC, which is incremented for every pixel received (when i_valid has a rising edge).

In this project we are going to look at how we can build a Sobel edge detection IP core using HLS and then include it within the Xilinx FPGA of our choice. The selected device could be a traditional FPGA such as a Spartan Seven or Artix, alternatively it could also be implemented within the programmable logic of a heterogeneous SoC like the Zynq 7000 or Zynq MPSoC.
