Gas Turbine Combustion

Combustion Gas Turbines are normally selected for driving large pumps, compressors, and generators. They are selected in horsepower ranges of 1000 to 270,000. Their efficiency can be improved by using waste heat recovery units.

Gas Turbine Combustion - an overview | ScienceDirect Topics

The gas turbine is the engine at the heart of the power plant that produces electric current. A gas turbine is a combustion engine that can convert natural gas or other liquid fuels to mechanical energy. This energy then drives a generator that produces electrical energy. It is electrical energy that moves along power lines to homes and businesses.

What is a Gas Turbine | Knowledge Base | GE Power Generation

A gas turbine, also called a combustion turbine, is a type of continuous and internal combustion engine. The main elements common to all gas turbine engines are: an upstream rotating gas compressor; a combustor; a downstream turbine on the same shaft as the compressor.

To transform the chemical energy of the fuel gas into mechanical energy, the fuel should be burnt in the "Combustion Chamber" of a Gas turbine, so I need air and heat added to the fuel. Air is let into the gas turbine through "Air Intake" and mixed with a proper amount of natural gas.

What is a Gas Turbine and How Does it Work? (For Beginners)

The combustion (gas) turbines being installed in many of today's natural-gas-fueled power plants are complex machines, but they basically involve three main sections: The compressor, which draws air into the engine, pressurizes it, and feeds it to the combustion chamber at speeds of hundreds of miles per hour.

A. Products of combustion enter a gas turbine with a ...

In a gas turbine engine, the combustor or combustion chamber is fed high pressure air by the compression system. The combustor then heats this air at constant pressure. After heating, air passes from the combustor through the nozzle guide vanes to the turbine. In the case of a ramjet or scramjet engines, the air is directly fed to the nozzle.

Combustor - Wikipedia

Combustion area - Burns the fuel and produces high-pressure, high-velocity gas Turbine - Extracts the energy from the high-pressure, high-velocity gas flowing from the combustion chamber The following figure shows the general layout of an axial-flow gas turbine -- the sort of engine you would find driving the rotor of a helicopter, for example:

The Gas Turbine Process | HowStuffWorks

The combustion process in a gas turbine can be classified as diffusion flame combustion, or lean- premix staged combustion. In the diffusion flame combustion, the fuel/air mixing and combustion take place simultaneously in the primary combustion zone.
