Digital Signal Processing With Dsp

Digital signal processing (DSP) is the use of digital processing, such as by computers or more specialized digital signal processors, to perform a wide variety of signal processing operations. The digital signals processed in this manner are a sequence of numbers that represent samples of a continuous variable in a domain such as time, space, or frequency.

Digital signal processing - Wikipedia

Digital signal processing (DSP) refers to various techniques for improving the accuracy and reliability of digital communications. The theory behind DSP is quite complex. Basically, DSP works by clarifying, or standardizing, the levels or states of a digital signal.

DSP stands for Digital Signal Processing. This term is used for digital encoding of “live” signals such

as audio, video, temperature, pressure, position, etc. Digital signal processing allows these live signals to be stored, manipulated, edited, replayed, and transferred much more efficiently and accurately than by using strictly analog methods.

What Is Digital Signal Processing (DSP)? And What Does It ...

Digital signal processing (DSP) hearing aids convert sounds entering the microphone into 'digitized' codes. To do so, digital hearing aids must analyse the incoming sound at regular intervals. The more frequently the hearing aid does this per second, the more accurate the digitized codes will be. The number of times a digital hearing aid analyses sounds per second is called the 'sampling rate'.
