Typically, the rate of enzymatic reactions increases with temperature (up to a point), this is because increased

temperature means increased energy means increased motion which makes for more frequent collisions of substrates with active sites. pH can have an impact on the functioning of an enzyme. For example, the stomach enzyme pepsin works best at a pH of about 1.5 and the enzyme trypsin, which acts in the small intestine, works best at a pH of about 8.

Organisms use the energy they convert to power cellular/organismal processes that decrease their overall entropy (or at least delay its increase). This process increases the entropy of their surroundings. Living systems are not the only systems in the universe that require energy conversion to function.
