The movement of molecules from areas of higher concentration to areas of lower concentration is called diffusion. Osmosis is the diffusion of water molecules across a semipermeable membrane. When the concentration levels of two solutions on either sides of the membrane are equal and no movement is detected, the solutions are isotonic.

Diffusion & Osmosis Lab - AP Bio

Diffusion is one result of this molecular movement. Diffusion is the random movement of molecules from an area of higher concentration to areas of lower concentration. Osmosis is a special kind of diffusion where water moves through a selectively permeable membrane (a membrane that only allows certain molecules to diffuse though).

Diffusion is the movement of molecules from an area of where there are many (high concentration) to an area where there are fewer (low concentration). Osmosis is the diffusion of water through a semipermeable membrane.

Potato Osmosis Lab — DataClassroom

Understanding the concepts of diffusion and osmosis is critical for conceptualizing how substances move across cell membranes. Diffusion can occur across a semipermeable membrane; however diffusion also occurs where no barrier (or membrane) is present. A number of factors can affect the rate of diffusion, including temperature, molecular weight, concentration gradient, electrical charge, and distance.

Conversely, osmosis is net diffusion of water across a (Patton 50). Water will diffuse from a region of low concentration of solutes to high concentration of solutes in order to obtain a more equal ratio of solute to solvent. This process requires no energy, as diffusion, but it must be noted that the solutes do not move, only water.
