Chevy moved the temperature sensor from the intake manifold into the head in 1967 because the coolant was boiling in the head while still not showing that high a temp in the intake. Chevy changed the head casting number just for this one engineering modification. This was in response to warranty claims from over heated engines.

Be it good or bad, 1967 saw some
 revisions made to the 396ci engine
 lineup. The base 396ci engine (RPO L35),
 still boasted 325 horsepower, and still
 used a cast-iron intake manifold with a
 single Quadrajet carburetor. There are
 rumors that a Holley carburetor did get
 placed on some 325 horsepower
 engines.
