Calcium ions (Ca²⁺) contribute to the

physiology and biochemistry of organisms cell. They play an important role in signal transduction pathways, where they act as a second messenger, in neurotransmitter release from neurons, in contraction of all muscle cell types, and in fertilization. Many enzymes require calcium ions as a cofactor, including several of the coagulation factors.

Abstract Calcium storage is one of the functions commonly attributed to the endoplasmic reticulum (ER) in nonmuscle cells. Several recent studies have added support to this concept. Analysis of reticuloplasm, the luminal ER content, has shown that it contains several proteins (reticuloplasmins) which

are prospective calcium storage proteins.

The endoplasmic reticulum and calcium storage

The concentration of calcium in the body tends to decline as we age because it is released from the body through sweat, skin cells, and waste. In addition, as women age, absorption of calcium ...

Calcium: Uses, Side Effects, Interactions, Dosage, and Warning

Calcium imaging is a microscopy technique to optically measure the calcium (Ca^{2+}) status of an isolated cell, tissue or medium. Calcium imaging takes advantage of calcium indicators, fluorescent molecules that respond to the binding of Ca^{2+} ions by changing

their fluorescence properties. Two main classes of calcium indicators exist: chemical indicators and genetically encoded calcium ...

The calcium is taken up into the matrix by the mitochondrial calcium uniporter on the inner mitochondrial membrane. It is primarily driven by the mitochondrial membrane potential. Release of this calcium back into the cell's interior can occur via a sodium-calcium exchange protein or via "calcium-induced-calcium-release" pathways.

Calcium is involved with a wide range of vital cell functions including enzyme activities, attachment, motility, tissue morphology, metabolic processes, signal-transduction, replication, and electrochemical responses by specialized cells such as muscle and

neural cells. It is stored primarily in the endoplasmic reticulum (ER).

In neurons, calcium ions can gain entry into the cell through several mechanisms. These include the over-activation of glutamate receptors (NMDA, AMPA, KA) or of a range of channels and transporters (TRPM2, TRPM7, NCX, ASICs, CaV1.2, and hemichannels).

reactions, cells keep the cytosolic calcium concentration quite low under normal conditions, using ATP-powered calcium pumps. For example, muscle

cells transport calcium from the cytosol into the membranous system called the sarcoplasmic reticulum (SR). If a resting muscle cell's cytosol has a free calcium ion concentration of 10^{-7} while the concentration in the SR is 10^{-2} , then which direction ...

The versatility of mitochondrial metabolism and its fine adjustments to specific physiological or pathological conditions regulate fundamental cell pathways, ranging from proliferation to apoptosis. In particular, Ca^{2+} signalling has emerged as a key player exploited by mitochondria to tune their activity according with cell demand.
