Historically, joint ROM has been measured by different methods, including goniometer, inclinometer, potentiometer, photometer or X-ray. Our technique of photographic measurement seems rapid and precise. In the literature, hip rotation ROM and balance measurements are usually obtained by goniometry.

Measurements were recorded during four clinical tests. These tests assessed the active range of motion of the first metatarsophalangeal joint with the subject weight-bearing, the passive range of motion with the subject weight-bearing, the passive range of motion with the subject non-weight-bearing, and the motion during a heel-rise.

In human clinical practice, the most used noninvasive technique to measure joint range of motion (ROM) is goniometry, which is a validated and practical technique (Ekstrand et al. 1982; MacDermind et al. 1999). The goniometry is performed with a measuring device, a goniometer, which measures joint angles (in degrees) during flexion, extension, lateral flexion and rotation, respectively.

Goniometry: is it a reliable tool to monitor passive joint ...

Three wrist angles were measured at the starting and ending points of the motion: flexion-extension, radial-ulnar deviation and dart throwing motion angle. The orientation of the dart throwing motion plane relative to the flexion-extension axis ranged between 28° and 57° among the tested population.
