A columnar database is a database management system that stores data in columns instead of rows. The goal of a columnar database is to efficiently write and read data to and from hard disk storage in order to speed up the time it takes to return a query.

What is columnar database? - Definition from WhatIs.com

While rows in an Excel database are referred to as records, the columns are known as fields. Each column needs a heading to identify the data it contains. These headings are called field names. Field names are used to ensure that the data for each record is entered in the same sequence. Data in a column must be entered using the same format.

By building the data column names using the column column names, you're sure to match them up correctly, no matter the physical order. Also, it lets you omit any pairs where the data column doesn't exist. Now we can make the names of the results columns, and assign them the results of multiplying each pair. We'll "loop" over the pairs using mapply.
