Contingency Analysis In Power System

Power System Security: Contingency Analysis. Power System Security: Contingency Analysis. ECG 740. 1. Background. • Power System Security involves practices designed to keep the system operating when components fail. • Most power systems are operated such that any single initial failure event will not leave other components heavily overloaded. • The above is referred to as the NERC (n-1) rule!, i.e., no single outage will result in flow or voltage violations.

Contingency analysis is a vitally important part of any power system analysis effort. Industry planners and operators must analyze power systems covering scenarios such as the long-term effects on the transmission system of both new generation facilities and projected growth in load. Market analysts and planners must make informed decisions regarding transactions for energy trade - whether that trade is for the next hour or months down the road.

Contingency Analysis: An Introduction

Contingency Analysis (CA) is one of the "security analysis" applications in a power utility control center that differentiates an Energy Management System (EMS) from a less complex SCADA system. Its purpose is to analyze the power system in order to identify the overloads and problems that can occur due to a "contingency".
