Bioremediation is the most proficient tool to manage the polluted environment and recover contaminated river water. Bioremediation is very much involved in the degradation, eradication, restriction, or reclamation varied chemical and physical hazardous substances from the nearby with the action of all-inclusive microorganisms.

Review on Bioremediation: A Tool to Resurrect the Polluted ...

Bioremediation may be defined as the process whereby a biological agent (e.g., bacteria, fungi, plants, enzymes) is used to reduce contaminant mass and toxicity in soil, groundwater, and air. The goal of bioremediation is to reduce toxicity and target contaminant concentrations in water and/or soil through either biodegradation (of organics) or biotransformation (of metals).

The Role of Microorganisms in Bioremediation- A Review

Bioremediation of contaminated groundwater or soil is currently the cheapest and the least harmful method of removing xenobiotics from the environment. Immobilization of microorganisms capable of degrading specific contaminants significantly promotes bioremediation processes, reduces their costs, and also allows for the multiple use of biocatalysts.
