Topological Transition Of Dirac Points

Dirac point movement can lead to a topological transition from semimetal to semiconductor when two inequivalent Dirac points merge, an idea that has attracted significant research interest. However, such movement normally requires unrealistically high lattice anisotropy.

At a critical asymmetry the Dirac points merge to open an energy gap, thus changing the topology of the eigenspectrum. The topological feature of the Dirac points is manifested by considering the magneto-optical effect. A photonic Chern “insulator” with two helical edge states is realized due to the breaking of time reversal symmetry (here photonic

There are 6 cones corresponding to the six vertices of the hexagonal first Brillouin zone. Dirac cones, named after Paul Dirac, are features that occur in some electronic band structures that describe unusual electron transport properties of materials like graphene and topological insulators. In these materials, at energies near the Fermi level, the valence band and conduction band take the shape of the upper and lower halves of a conical surface, meeting at what are called Dirac points.

By direct calculation of the invariant, we confirm that an electronic phase transition from a topological insulator to a band insulator occurs when the electric field passes a critical value. The positions of the Dirac points are related to each other by the inversion symmetry around the symmetry points Γ and M_1 , M_2 and M_3 . Finally, at $t_3 = t_1 + t_2$, where the lines leave the pink triangle in order to enter region A_3 , the Dirac points merge at M_3 and the system undergoes a phase transition from a semimetal to an insulator.

Topological phase transitions happen

when the band gap closes. It is not true that all band crossings are topological. There are Dirac (linear) band crossings, quadratic band crossings, Dirac-like triply degenerate band crossings, double Dirac cone crossings, semi-Dirac transitions (linear in one direction and quadratic in another) etc.

Do topological transitions only occur at Dirac points?

The Dirac Hamiltonian plays a central role in the theory of topological materials. Its significance follows from the fact that in the presence of Time Reversal Symmetry a three-dimensional Dirac fermion appears at the topological phase boundary between a normal insulator and a topological insulator. www.annualreviews.org Short title 3 to
