There are two problems with applying an ordinary linear regression model to these data. First, many distributions of count data are positively skewed with many observations in the data set having a value of 0. The high number of 0's in the data set prevents the transformation of a skewed distribution into a normal one.

Regression Models for Count Data - The Analysis Factor

Count data regression is useful in studying the occurrence rate per unit of time conditional on some covariates. One could instead study the distribution of interarrival times conditional on covariates. This leads to regression models of waiting times or durations. The type of data available, cross-sectional, time series, or longitudinal, will affect the choice of the statistical framework.

Regression Models with Count Data - IDRE Stats

Count data reflect the number of occurrences of a behavior in a fixed period of time (e.g., number of aggressive acts by children during a playground period). In cases in which the outcome variable is a count with a low arithmetic mean (typically < 10), standard ordinary least squares regression may produce biased results.

In statistics, Poisson regression is a generalized linear model form of regression analysis used to model count data and contingency tables. Poisson regression assumes the response variable Y has a Poisson distribution, and assumes the logarithm of its expected value can be modeled by a linear combination of unknown parameters. A Poisson regression model is sometimes known as a log-linear model ...

Poisson regression - Wikipedia

This course deals with regression models for count data; i.e. models with a response or dependent variable data in the form of a count or rate. A count is understood as the number of times an event occurs; a rate as how many events occur within a specific area or time interval.
