In molecular cloning and biology, a knock-in (or gene knock-in) refers to a genetic engineering method that involves the one-for-one substitution of DNA sequence information in a genetic locus or the insertion of sequence information not found within the

locus.

Gene knock-in - Wikipedia

A gene knockout is a genetic technique in which one of an organism's genes is made inoperative. However, KO can also refer to the gene that is knocked out or the organism that carries the gene knockout. Knockout organisms or simply knockouts are used to study gene function, usually by investigating the effect of gene loss. Researchers draw inferences from the difference between the knockout organism and normal individuals. The KO technique is essentially the opposite of a gene knock-in. Knocking

Gene knockout - Wikipedia

Gene knockout methods are used for the identification of a specific gene function by inhibiting the function of the particular gene. Gene knockout has its application both in classical genetics and modern techniques such as functional genomics. During the initial timescale, gene knockout was carried out using transposon mutagenesis. The major disadvantage of that method is the laborious screening to find the knocked out gene. Knockout of other organism has been carried out using genetic engineering.
