The wrist is an ellipsoidal (condyloid) type synovial joint, allowing for movement along two axes. This means that flexion, extension, adduction and

abduction can all occur at the wrist joint. All the movements of the wrist are performed by the muscles of the forearm.

**The Wrist Joint - TeachMeAnatomy**

The wrist has two degrees of freedom, although some say three degrees of freedom because they include the movements of pronation and supination, which occur at the the radioulnar joint. The radioulnar joint is often referred to as a joint of the forearm but it is this articulation that gives the wrist more freedom of movement.
