Structural Equation Modeling And Causal

Structural equation modeling is a statistical technique for testing and estimating causal relations using a combination of statistical data and qualitative causal assumptions. This definition of SEM was articulated by the geneticist Sewall Wright, the economist Trygve Haavelmo and the cognitive scientist Herbert A. Simon, and formally defined by Judea Pearl using a calculus

of counterfactuals.

(Jöreskog, 1970; Wright, 1934).

Structural Equation Modeling: Definition and Analysis

Comparing structural equation models to the potential-outcome framework, Sobel (2008) asserts that “in general (even in randomized studies), the structural and causal parameters are not equal, implying that the structural parameters should not be interpreted as effect.”

Structural equation modeling also goes by several other names: causal modeling, causal analysis, simultaneous equation modeling, analysis of covariance structures, path analysis, and confirmatory factor analysis. When exploratory factor analysis is combined with multiple regression analyses, the result is structural equation modeling (SEM).

Structural Equation Modeling - ThoughtCo

Sociologists originally called causal models structural equation modeling, but once it became a rote method, it lost

its utility, leading some practitioners to reject any relationship to causality. Economists adopted the algebraic part of path analysis, calling it simultaneous equation modeling.
