Fluid Structure Interaction An Introduction

Fluid-structure interaction is the interaction of some movable or deformable structure with an internal or surrounding fluid flow.

Fluid-structure interactions can be stable or oscillatory. In oscillatory interactions, the strain induced in the solid structure causes it to move such that the source of strain is reduced, and the structure returns to its former state only for the process to repeat. Fluid-Structure Interaction: An Introduction to Finite Element Coupling progresses logically from formulations and applications involving structure and fluid dynamics, fluid and structure interactions and opens to reduced order-modelling for vibro-acoustic coupling. The author describes simple yet fundamental illustrative examples in detail, using analytical and/or semi-analytical formulation & designed both to illustrate each numerical method and also to highlight a physical aspect of FSI.

Abstract. The paper presents an

introduction to two general approaches used in the solution of coupled structures and fluid systems in which effects of large scale flow are excluded. In the first approach, the Lagrangian, the fluid is simply treated as a 'solid' with a negligible shear modulus. In the second method, Eulerian, a single pressure variable is used in the fluid.
