A Tutorial On Transmission Line

A transmission line is a connector which transmits energy from one point to another. The study of transmission line theory is helpful in the effective usage of power and equipment. There are basically four types of transmission lines – Two-wire parallel transmission lines; Coaxial lines; Strip type substrate transmission lines; Waveguides

Assume we have a transmission line in which air separated the two perfect conductors. Assume the impedance of the line is 50 ohm, phase constant is 20 (rad/m) and the operating frequency is 700MHz. Calculate the line inductance/meter and capacitance/ meter ! Refer to the Microstrip Transmission Line Applet and design a 33 ohm microstrip. Assume

INTRODUCTION TO TRANSMISSION LINES

With the transmission line clearly defined as a circuit element, it can now be analyzed when a load is attached. We define the load to be located at z=0 to simplify the analysis. The current and voltage at the load can be related by the load impedance. Using equations 10 & 15, while setting z=0, we get.

Transmission Lines - Basic Theories

The transmission line system is a "direct radiator" alignment that is designed to use the 1/4 wave resonances in a waveguide to enhance and extend its useful range of operation. The waveguide reverses the phase of the driver's rear output by the time it reaches the terminus, thereby reinforcing the output near the lowest resonance frequency of the waveguide.

Medium Transmission Line. A medium transmission line is classified as a transmission line with: A length more than 80 km (50 miles) but less than 250 km (150 miles) Operational voltage level is from 69 kV to approx 133 kV; Capacitance effect is present; Distributed capacitance form is used for calculation purpose. There are the following demerits of the co-axial cable used as transmission line. This type of transmission line is costly with respect to two wire lines. Designing of co-axial cable is difficult as compared to two wire lines. This type of transmission lines handles low power transmissions. Formula for the impedance is; Impedance. $Z_0 = 233 \log_{10} D/d$

Consider the transmission line circuit shown in Figure 3. A sinusoidal voltage source, S , with internal impedance S , drives a transmission line with characteristic impedance C and length L , terminated with a load L . When the switch closes a forward voltage, $+$ and current wave, $+$, originate at $z = 0$ and travel towards the load, $[2]$. Note: (z) and (z) denote the total complex voltage and current, respectively, at any location z along the line. Figure 3: Transmission line circuit and a forward wave

Transmission Line Faults The fault analysis of a power system is required in order to provide information for the selection of switchgear, setting of relays and stability of system operation. A power system is not static but changes during operation (switching on or off of generators and transmission lines) and during planning (addition of generators and transmission lines).

A transmission as it is also an electrical network, and hence the transmission line can be represented as a two-port network. Hence two-port network of the transmission line can be represented as 2 by 2 matrix. Here the concept of ABCD parameters comes into play. Voltage and currents of the network can be represented as:
