Signal-image interpolation is normally used for several procedures, and they are hereto listed. When pixel-by-pixel correspondence has to be established for the purpose of matching images collected at different times using the same imaging modality (registration) or different imaging modalities (co-registration), interpolation finds immediate application in motion correction techniques.

To generate output signals efficiently a special DAC8580 (6) device was selected for its integrated interpolation filter, which is especially suitable for the multichannel transceiver system because the interpolation function allows an accurate waveform to be reconstructed from a small number of stored samples. The DAC8580 can oversample the signal by 2, 4 8 or 16 times.
