Mathematical Optimization of Water Networks - springer

Out of the different stages into which water network optimization can be subdivided, we focus on the somewhat different tasks of optimal design of water networks on the one hand and optimal operation of water networks on the other. On both sides, one assumes to have an underlying network with a fixed topology, i.e., a fixed set of nodes and arcs representing sources, sinks, pipes, pumps, valves, and tanks.

Abstract. We introduce a mixed integer linear modeling approach for the optimization of dynamic water supply networks based on the piecewise linearization of nonlinear constraints. One advantage of applying mixed integer linear techniques is that these methods are nowadays very mature, that is, they are fast, robust, and are able to solve problems with up to a huge number of variables.
