A three-phase motor must be wired based on the diagram on the faceplate. The first step is to figure out the voltage of your phases. In the United States, for low voltage motors (below 600v), you can expect either 230v or 460v. That being said, there is a wide range of different motors and what you have on hand can be completely different. Make sure that the voltage you will be supplying to your motor matches the specifications on the faceplate.

It is not always clear what a customer wants. A typical request for a three phase motor may state that the power supply is 50 Hertz, 220/380 volts. This generally means 380 volts, three phase/220 volts, single phase. If the request is for a 3/50/220/380 motor, the customer may want to use the motor on 220 volt power supply with a wye-delta starter.

A Repulsion Electric Motor is by definition a single phase motor which has a stator winding arranged for connection to the source of power and a rotor winding connected to a commutator. Brushes and commutators are short-circuited and are placed so that the magnetic axis of the rotor

winding is inclined to the magnetic axis of the stator winding.

Construction of Three Phase Induction Motor | Electrical4U

In Delta Connection, Motor receives highest Power output. In Star Connection, the phase voltage is low as $1/\sqrt{3}$ of the line voltage. Therefore, it needs a low number of turns, hence saving in copper. In Delta connection, The phase voltage is equal to the line voltage, hence it needs more number of turns which increase the total cost.
