Bonding. Compounds are formed when two or more atoms join together, forming Bonds. There are different types of bonds that occur between atoms which give rise to different properties. Ionic Bonds. Ionic Bonds form when electrons are transferred from one atom to another, forming charged Ions which are attracted to each other by Electrostatic Forces.

Bonding | A Level Notes

Chemical bonding deals with the study of formation of compounds out of elemental forms of atoms. Various forms of bonding may be classified into the following types. Ionic Bonding: The other name of Ionic bonding is electrovalent bonding; the molecular linkages are formed by the electrostatic attraction among oppositely charged ions.

A chemical bond can be characterized by strength which is the measure of the energy required to break the bond between two atoms. If the bond energy (also referred to as bond enthalpy) is higher, it means that the bond is stronger. Similarly, low bond energy value depicts that the bond is weak; therefore, it is quite easy to break it.
