Mining Centrifugal Pump Operation Basic

The basic concept behind the centrifugal pump is not a complicated one, but rather effective. The pump is set up with a hollow casing with vanes and impellers rotating inside of it. This rotation is facilitated by a running motor, which creates the kinetic energy necessary to move the fluid inside.

A formula for NPSHA can be stated as the following equation. $NPSHA = P_{suction} - P_{saturation}$. When a centrifugal pump is taking suction from a tank or other reservoir, the pressure at the suction of the pump is the sum of the absolute pressure at the surface of the liquid in the tank plus the pressure due to the elevation difference between the surface of liquid in the tank and the pump suction less the head losses due to friction in the suction line from the tank to the pump.

Pumps 101: Operation, Maintenance and Monitoring Basics

The quickest way to get up to speeds is to survey the landscape and gain an understanding of the most fundamental topics of centrifugal pump design, application, and selection. The following articles assume no prior pump knowledge, start from the beginning, and cover the basic fundamentals.

Pumps 101 | Intro to Pumps

A centrifugal pump operates through the transfer of rotational energy from one or more driven rotors, called impellers. The action of the impeller increases the fluid's velocity and pressure and directs it towards the pump outlet. With its simple design, the centrifugal pump is well understood and easy to operate and maintain.

Centrifugal Pumps : Principles, Operation And Design

Some of the most common pumps used for mine dewatering are submersible centrifugal pumps (pump and motor in one unit, all submerged underwater), submersible turbines (pump and motor installed in a well or cooling sleeve and submerged), and vertical turbines, either

installed on a float in a pond/lake or in a well (pump end and column pipe submerged with motor mounted on a motor stool above ground/water).

Selecting Pumps for Mining Applications | Pumps & Systems

A centrifugal pump utilizes rotation to pass on velocity in the direction of the fluid. Each centrifugal pump uses a hydraulic component like an impeller that turns to pass on velocity toward the pumped fluid. This pump mainly used to change the velocity into liquid flow. Each pump uses a hydraulic component like a casing that captures the velocity which is informed by the impeller & directs the pushed fluid toward the pump expulsion end.
