Flow-induced vibration of pipelines and piping can be caused by a number of mechanisms including: * Pumps and compressors which could produce pressure pulsations, exciting a response in nearby piping * Fluctuating flow past obstructions or objects in the flow (for

example, thermowells or other intrusions in the flow) and piping dead legs

Pipeline flow-induced vibration | Engineer Live

Flow-induced vibration, or vortex shedding, is due to high flow velocities such as in a piping dead leg of a centrifugal compressor system. This study evaluates vortex shedding and potential vibration across dead leg branches. The study can also include FIV excitation of small-bore piping and components in the flow, such as thermowells.

in piping passing the entry to a closed end sidebranch, can generate vortices which coincide with strong acoustic resonances in the sidebranch and result in pulsations being generated which propagate both upstream and downstream within the main line. These pulsations impart periodic, mainly axial, forces at pipe bends and this can quickly shake the whole pipe system.

Flow Induced Pulsation (FIP) | Spectrum Acoustic

Spectrum undertook analysis of flow induced turbulence (FIT) and flow induced excitation/pulsation. For the latter we use our PIPAC® (PIPework ACoustics) software to establish acoustic resonant lengths in complex pipework arrangements. In addition we looked at

Acoustic Induced Vibration AIV /HFAE/Acoustic Fatigue). We recommended a range of modifications to the system.

The course can also benefit anyone involved in the design, engineering and troubleshooting of pulsation and vibration in gas stations or those wishing to extend the operation beyond design conditions. Participants should possess certain basic knowledge of gas flow and gas transmission systems.

Vibration is caused by a number of sources, including: External flow: tidal or

Previous design stage analysis carried out by Xodus showed that there was a potential risk of Vibration Induced Fatigue Failure to the turret gas lift system pipework due to Flow Induced Pulsation (FLIP) originating in the corrugated risers. The Client therefore imposed a safe operating flowrate through the gas lift risers of 55 MMSCFD.

Flow Induced Pulsation (FLIP)

Assessment | Xodus Group

The vibration or pulsation problems below are caused by this phenomenon (refer to Fig. 5.19): 1. Swirling flow which arises in a suction pipe and contains many air bubbles causes an unbalanced torque to the pipe. This can be a cause of structural vibrations and noise. 2. An air column is interrupted by the turbo-pump impeller.

Vibration Induced by Pressure Waves in Piping - ScienceDirect

Typical symptoms of flow-induced acoustic problems are high machine noise levels, nonsynchronous shaft vibration, compressor casing or bearing housing vibration, and impeller fatigue damage. Severe vibration and

accompanying noise of main gas piping, with excitation of shell resonances, and fatigue of small attached piping elements can also occur.

Flow Induced Vibration (FIV) In piping system, the turbulent energy is generated by fluid flow, hence, the process condition as well as pipe geometry has to be considered together for quantitative assessment of flow induced vibration (FIV).
