The wavelets are generated from a single basic wavelet  $\psi(t)$ , the so-called mother wavelet, by scaling and translation:  $\psi_{a,b}(t) = \frac{1}{\sqrt{a}} \psi(\frac{t-b}{a})$  where  $a$  is the scale factor,  $b$  is the translation factor and the factor  $1/\sqrt{a}$  is for energy normalization across the different scales.

C.Vallens - A Really Friendly Guide to Wavelets

A wavelet is a mathematical function used to divide a given function or continuous-time signal into different frequency components and study each component with a resolution that matches its scale. A wavelet transform is the representation of a function by wavelets. The wavelets are scaled and translated copies (known as "daughter wavelets") of a finite-length or fast-decaying oscillating waveform (known as the "mother wavelet").
