Stirling Engines

A Stirling engine is a heat engine that is operated by a cyclic compression and expansion of air or other gas (the working fluid) at different temperatures, resulting in a net conversion of heat energy to mechanical work. More specifically, the Stirling engine is a closed-cycle regenerative heat engine with a permanent gaseous working fluid. Closed-cycle, in this context, means a thermodynamic ...

Stirling engines are capable of reaching 50% efficiency, which far outperforms the steam engine. They are also known for their quiet, efficient operation, and benefit from being able to use almost any heat source, which is applied externally, rather than internally.

Stirling Engine Kits - Build Your Own Stirling Engine

Stirling engines are able to capture and re-use some of the heat that would otherwise be wasted by using an internal heat exchanger called a regenerator. A regenerator is anything inside the Stirling engine, usually a specifically designed part, that allows heat to be stored from one cycle and used again in the next cycle.

The Stirling radioisotope generator (SRG) is a type of radioisotope generator based on a Stirling engine powered by a large radioisotope heater unit.The hot end of the Stirling converter reaches high temperature and heated helium drives the piston, heat being rejected at the cold end of the engine. A generator or alternator converts the motion into electricity.

Stirling Engine - Real World Physics Problems

A Stirling engine is a specific flavor of heat engine formulated by Robert Stirling in 1816; this means it can transform the flow of heat into mechanical work (such as spinning a crankshaft).

Thermodynamic Theory of the Ideal Stirling Engine

Stirling engines (formerly referred to as steam engines) are the second tier of engine. They use cobblestone instead of wood or iron so are still cheaper than the Combustion Engine. Previously, it had been stated that Stirling Engines would not blow up and would simply stop operating when heated too much.
