Abstract: The use of environmental biotechnology for the remediation of contaminated land is a rapidly growing field. This paper reviews the current state of the art in this field, with particular emphasis on the use of microorganisms for the remediation of contaminated land. The paper discusses the various types of bioremediation, the factors that influence the success of bioremediation, and the current state of the art in the use of bioremediation for the remediation of contaminated land. The paper also discusses the potential for the use of bioremediation in the future, and the challenges that must be overcome in order to make bioremediation a viable option for the remediation of contaminated land.
