The Physics of Roller Coaster Loops. The most obvious section on a roller coaster where centripetal acceleration occurs is within the so-called clothoid loops. Roller coaster loops assume a tear-dropped shape that is geometrically referred to as a clothoid. A clothoid is a section of a spiral in which the radius is constantly changing.

Before we proceed any further with the analysis of what forces a person experiences on a roller coaster, we will assume that the roller coaster car does not experience any friction or air

resistance. With that in mind, there will be two forces that act upon the roller coaster car: the FORCE OF GRAVITY (F_{GRAV}) and the Normal Force (F_{NORMAL}). The normal force is directed in the direction of the track, while the gravitational force is always directed downwards.

The Physics Of Roller Coasters » Science ABC

The kinetic energy of the roller coaster is: where v is the speed of the roller coaster. If we assume no friction losses, then energy is conserved. Therefore, Thus, mass cancels out, and This result is nice because it allows us to approximate the speed of the roller coaster knowing only the vertical height h that it fell (on any part of the track). Of course, due to friction losses the speed will be a bit less than this, but it is very useful nonetheless.

When the roller coaster cart travels down hill it accelerates (the velocity increases), and when the roller coaster cart travels up hill it decelerates (the velocity decreases). We are able to calculate the velocity of the roller coaster cart at any time by using the formulas given on the Motion page. The mass of the roller coaster cart will remain constant if the cart is empty; however, as people will be riding into the cart, the mass of the people also needs to be taken into account.
