When there is no obvious whole-number
solution to the quadratic factorization,
the quadratic formula must be used. It
can be shown by the method of

completing the square that the solutions to $ax^2 + bx + c = 0$ are given by $x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$. If we let the roots be k and l , say, then $k = \frac{-b + \sqrt{b^2 - 4ac}}{2a}$ and $l = \frac{-b - \sqrt{b^2 - 4ac}}{2a}$. Then $ax^2 + bx + c = a(x - k)(x - l)$.

Factorising Exercises - UWA

To factorise an algebraic expression, we must determine the highest common factor (HCF) of the terms and insert grouping symbols, usually parentheses. If we expand the expression $5a(a - 2)$ we obtain $5a^2 - 10a$. To factorise $5a^2 - 10a$ we simply reverse the process.
