Electric Fields Of The Brain

Electroencephalography (EEG) is practiced by neurologists, cognitive neuroscientists, and others interested in functional brain imaging. Whether for clinical or experimental purposes, all studies share a common purpose-to relate scalp potentials to the underlying neurophysiology. Electrical potentials on the scalp exhibit spatial and temporal patterns that depend on the nature and location of the sources and the way that currents and fields spread through tissue.

10 Things an Electromagnetic Field Can Do to Your Brain

That task requires an electric current, which is why TMS relies on a magnetic pulse rather than a static magnetic field. When this pulse is delivered via an electromagnetic coil placed against the

scalp, the resulting current jolts a particular part of the brain with the aim of treating neurological diseases like depression.

Researchers in the US have recorded neural spikes travelling too slowly in the brain to be explained by conventional signalling mechanisms. In the absence of other plausible explanations, the scientists believe these brain waves are being transmitted by a weak electrical field, and they've been able to detect one of these in mice. "Researchers have thought that the brain's endogenous electrical fields are too weak to propagate wave transmission," said Dominique Durand, a biomedical engineer ...

In Electric Brain, world-renowned neuroscientist and author R. Douglas Fields takes us on an enthralling journey into the world of brainwaves, detailing how new brain science could fundamentally change society, separating fact from hyperbole along the way.

Electric Brain - Douglas Fields

Water comprises 70% of the brain, and quantum brain dynamics

(QBD) proposes that the electric dipoles of the water molecules constitute a quantum field, referred to as the cortical field, with corticons as the quanta of the field. This cortical field is postulated to interact with quantum coherent waves generated by the biomolecules in neurons, which are suggested to propagate along the neuronal network.

All electrical currents in a section of the brain combine to form the voltage potential that is the sum of all the activity. This activity is different at each point and forms what is called an "electrical field." The electrodes measure this field in the range of milliseconds.

No doubt, the brain has its electric and magnetic field, but they are relatively weak compared with the heart's that is about 100 times stronger electrically and 5000 times stronger magnetically! Our physical world as we know it is made of these two energy fields: electrical and magnetic.

The heart is 5000 times stronger magnetically than the brain!
