Abstract The lectures provide an introduction to basic results in the thermodynamics and kinetics of nucleation and to some applications of the theory. The thermodynamic considerations are focused on the supersaturation dependence of the nucleus size and the nucleation work. The kinetic considerations show how the general formula for the nucleation rate is obtained in the scope of the generally accepted molecular model of nucleation.

localized formation of a distinct thermodynamic phase. • Nucleation can occur in a gas, liquid or solid phase. Some examples of phases that may form via nucleation include: 1) in gas: Creation of liquid droplets in saturated vapor; 2) in liquid: formation of gaseous bubbles, crystals (e.g., ice formation from water), or glassy regions; 3) in solid: Nucleation of crystalline, amorphous, and even vacancy clusters in solid materials.

Nucleation Theory Lecture Notes In Physics

Classical nucleation theory is the most common theoretical model used to quantitatively study the kinetics of nucleation. Nucleation is the first step in the spontaneous formation of a new thermodynamic phase or a new structure, starting from a state of metastability. The kinetics of formation of the new phase is frequently dominated by nucleation, such that the time to nucleate determines how long it will take for the new phase to appear. The time to nucleate can vary by orders of magnitude, fr
