The Mathematics Of Nonlinear Programming

Nonlinear programming provides an excellent opportunity to explore an interesting variety of pure and solidly applicable mathematics, numerical

analysis, and computing. This text develops some of the ideas and techniques involved in the optimization methods using calculus, leading to the study of convexity. This is followed by material on basic numerical methods, least squares, the Karush-Kuhn-Tucker theorem, penalty functions, and Lagrange multipliers.

In mathematics, nonlinear programming is the process of solving an optimization problem where some of the constraints or the objective function are nonlinear. An optimization problem is one of calculation of the extrema of an objective function over a set of unknown real variables and conditional to the satisfaction of a system of equalities and inequalities, collectively termed constraints. It is the sub-field of mathematical optimization that deals with problems that are not linear.

Nonlinear programming - Wikipedia

The mathematics of nonlinear programming is very complex and will not be considered here. We will illustrate

nonlinear programming with the aid of a number of examples solved using the package. A restricted capacity free copy of some software from Lindo Systems for solving nonlinear programs is available here. Another package is available here

Nonlinear programming

An optimization problem is nonlinear if the objective function $f(x)$ or any of the inequality constraints $c_i(x) \leq 0$, $i = 1, 2, \dots, m$, or equality constraints $d_j(x) = 0$, $j = 1, 2, \dots, n$, are nonlinear functions of the vector of variables x . For example, if x contains the components x_1 and x_2 , then the function $3 + 2x_1 - 7x_2$ is linear, whereas the functions $(x_1)^3 + 2x_2$ and $3x_1 + 2x_1x_2 + x_2$ are nonlinear.

$2 + (x_1 + x_2)^2$], subject to: $g_1(x) = x_1 + x_2 \leq 5$, $x_1 \geq 0$, $x_2 \geq 0$, (that is, $g_2(x) = -x_1$, $g_3(x) = -x_2$). The nonnegative constant θ reflects his tradeoff between risk and return. If $\theta = 0$, the model is a linear program, and he will invest

completely in the investment with greatest expected return.

Nonlinear Programming 13

Fractional programming studies optimization of ratios of two nonlinear functions. The special class of concave fractional programs can be transformed to a convex optimization problem. Nonlinear programming studies the general case in which the objective function or the constraints or both contain nonlinear parts. This may or may not be a convex program.

Unconstrained nonlinear programming is the mathematical problem of finding a vector x that is a local minimum to the nonlinear scalar function $f(x)$. Unconstrained means that there are no restrictions placed on the range of x $\min_x f(x)$ The following algorithms are commonly used for unconstrained nonlinear programming:

Nonlinear Programming - MATLAB & Simulink

Mathematically, the nonlinear programming problem may be expressed as below, where $x = (x_1, x_2, \dots, x_n)$

..., x_n) are the variables of the problem, f is the objective function, $g_i(x)$ are the inequality constraints, and $h_j(x)$ are the equality constraints.
