The phonon dispersion relation shows the full symmetry of the crystal. Except for the acoustic modes at $q = 0$, the dispersion relation is smooth and page 13 continuous. For points lying on a mirror plane of the reciprocal lattice, the dispersion relation must, therefore, have zero gradient in a direction perpendicular to the mirror plane.

For a crystal that has at least two atoms in its primitive cell, the dispersion relations exhibit two types of phonons, namely, optical and acoustic modes corresponding to the upper blue and lower red curve in the diagram, respectively. The vertical axis is the energy or frequency of phonon, while the horizontal axis is the wavevector.

Phonon - Wikipedia

The phonon dispersion relations are defined as the k dependence of the frequencies, ω_k , of the normal modes for all branches j and selected directions in the crystal (Figure 1). The number of phonon branches, $j = 1, 2, \dots, 3r$, is equal to the number of degrees of freedom in the primitive unit cell.

The dispersion relation of phonons is also non-trivial and important, being directly related to the acoustic and thermal properties of a material. For most systems, the phonons can be categorized into two main types: those whose bands become zero at the center of the Brillouin zone are called acoustic phonons, since they correspond to classical sound in the limit of long wavelengths.
