Analytic solutions do not exist, but the Levenberg–Marquardt algorithm, a modified Gauss–Newton algorithm, is often used to fit these equations to voltage-clamp data. The FitzHugh–Nagumo model is a simplification of the Hodgkin–Huxley model. The Hindmarsh–Rose model is an extension which describes neuronal spike bursts.

Few grand challenges are more daunting than the intertwined mathematical, neurological, and cognitive mysteries of the brain. This monograph addresses all three, beginning with a simple new

neural model that uses spike timing, approximates known neural behavior, and is capable of fast learning. The model is validated by both theory and simulations. A new Shannon information metric (bits/neuron) that measures the recoverable learned information that resides in synaptic strengths is then derived.

Cognon

A neural network model based on pulse generation time can be established accurately. Spike coding is adopted in this new neural network. Using the exact time of pulse occurrence, a neural network can employ more information and offer stronger computing power. Pulse-coupled neural networks (PCNN) are often confused with SNNs.

The standard approach to fitting an autoregressive spike train model is to maximize the likelihood for one-step prediction. This maximum likelihood estimation (MLE) often leads to models that perform poorly when generating samples recursively for more than one time step. Moreover, the generated spike trains can fail to capture important features of the data and even show diverging firing rates ...
