Abstract. Optically transparent hybrid organic-inorganic nanocomposites based on poly (titanium oxide) gels and hydroxyethylmethacrylate (HEMA, with different component ratios, and terpolymers containing lactide or glycolide as a third component) have been synthesized using a two-stage method. Exchange reactions between HEMA and titanium isopropoxide, and hydrolytic polycondensation of titanium alkoxide in the organic monomer agent have been detected.

Nanocomposites were also prepared by extrusion compounding, with or without the aid of CO₂. The effect of processing conditions

on the degree of clay dispersion was studied. The relationships between clay dispersion, surfactant thermal stability and the resulting thermal properties, e.g., thermal stability, dimension stability, fire resistance were investigated.
