Principal Components Analysis Pca

Principal Components Analysis (PCA) is an algorithm to transform the columns of a dataset into a new set of features called Principal Components. By doing this, a large chunk of the information across the full dataset is effectively compressed in fewer feature columns.

Principal Component Analysis (PCA) - Better Explained | ML+

Principal component analysis (PCA) is the process of computing the principal components and using them to perform a change of basis on the data, sometimes using only the first few principal components and ignoring the rest. PCA is used in exploratory data analysis and for making predictive models.

Principal component analysis - Wikipedia

Principal component analysis, or PCA, is a statistical procedure that allows you to summarize the information content in large data tables by means of a smaller set of “summary indices” that can be more easily visualized and analyzed.

What is principal component analysis (PCA) and how it is used?

For PCA this means that we have the first principal component which explains most of the variance. Orthogonal to that is the second principal component, which explains most of the remaining

variance. This is repeated for N number of principal components, where N equals to number of original features.
