The bsts package allows for non-Gaussian error families in the observation equation (as well as some state components) by using data augmentation to express these families as conditionally Gaussian. As of version 0.7.0, bsts supports having multiple observations at the same time point. In this case the basic model is taken to be

A vector of time stamps (of the same type as the timestamps used to fit object), with one per row of newdata (or element of newdata, if newdata is a vector). The time stamps give the time points as which each prediction is desired. They must be interpretable as integer (0 or larger) time steps following the last time stamp in object.

Though the models need not be fit using Bayesian methods, they have a Bayesian flavor and the bsts package was built to use Bayesian posterior sampling. The bsts package is open source. You can download it from CRAN with the R command `install.packages("bsts")`. It shares some features with Facebook and Google systems, but it was written with different goals in mind.

How to make the results of bsts robust using R?

In the bsts package, this is done by passing a prior object as created by the `SpikeSlabPrior` function. In this example we are specifying a prior of 0.6 on the variable called `unemployment.office` and forcing this variable to be selected by setting its prior spike parameter to 1. We're giving our priors a weight of 200 (measured in observation count), which is fairly large given that the dataset has 456 records.

Bayesian structural time series model is a statistical technique used for feature selection, time series forecasting, nowcasting, inferring causal impact and other applications. The model is designed to work with time series data. The model has also promising application in the field of analytical marketing. In particular, it can be used in order to assess how much different marketing campaigns have contributed to the change in web search volumes, product sales, brand popularity and other releva

Bayesian structural time series - Wikipedia

Add a local linear trend model to a state specification. The local linear trend model assumes that both the mean and the slope of the trend follow random walks. The equation for the mean is
$$\mu_{t+1} = \mu_t + \delta_t + \epsilon_t \quad \epsilon_t \sim \mathcal{N}(0, \sigma_\mu)$$
 The equation for the slope is
$$\delta_{t+1} = \delta_t + \eta_t \quad \eta_t \sim \mathcal{N}(0, \sigma_\delta)$$
